

ECLIPSE IN IROKO

SOLAR SHOWER

The choice of smooth, geometrical forms gives this shower style and distinction, making it a timeless decorative object. The wood structure is 2m07 high and finely proportioned, featuring a 17 cm-wide front panel, with the thickness of the wood being 24 mm. The structure is made of Iroko, an exotic African wood extremely hard, which likes contact with water, also "aquatic wood". At the back, the **Solar Shower** is fitted with a black, thermo-lacquered stainless steel tank for storing water and keeping it heated using the sun's rays. A thermostatic tap installed at the tank's top outlet supplies the shower directly with a mix of hot and cold water. Consequently, temperature adjustments are made out of the reach of children. The tank has a hot water capacity of 17 litres, which is the equivalent of approximately 42 litres of mixed water. Components for fastening the unit to the ground are provided in order to ensure outstanding stability.

For maximum efficiency, you need to orient the back of the shower southwards.

The 75 cm x 80 cm grating is built into the structure but can be removed at any time without adversely affecting the stability of the unit as a whole. This show can be supplied with or without the grating.

Standard:
Without grating

Option:
Grating 75 x 80 cm in Iroko

Total height: 2m07
Front panel width: 17 cm
Width of the sides: 13 cm
